Group Assignment:

- *For Tuesday.*
 - Do the Groupwork problems (#1-10) from **Factoring**, Problem Set #7
- *For Thursday.*
 - Do the Groupwork problems (#1-5) from **Factoring**, Problem Set #8
- *For either day:*
 - *Puzzle!* Stolen Chocolate. Somebody stole Bob's chocolate bar. Jerry, Mary and Larry were suspected. Jerry said, "I didn't do it!" Mary said, "Larry didn't do it!" And Larry said, "Yes, I did!" At least two of them lied. Who stole the chocolate bar?

Individual Work

- Pick and choose which problems you need to work on from Problem Sets #7 and #8.

— Factoring —
Problem Set #7

Group Work

You will now practice factoring trinomials that have a number before x^2 .

For example, try factoring $42x^2 + 41x + 9$. It can be helpful to write the pairs of factors of 42 (which are 1,42; 2,21; 3,14; & 6,7) and 9 (1,9; 3,3). The answer turns out to be $(14x + 9)(3x + 1)$.

Factor.

- 1) $7x^2 + 30x + 8$
- 2) $7x^2 - 15x + 8$
- 3) $7x^2 - x - 8$
- 4) $7x^2 + 10x - 8$
- 5) $7x^2 - 55x - 8$

— Factoring —
Problem Set #8

Group Work

We will now begin solving *quadratic equations*, which are equations with an x^2 term.

The key to this is realizing that if the product of two terms equals zero, then one of the two terms must be equal to zero. In other words, if $a \cdot b = 0$, then either a or b must be zero. Likewise, if $(x-3)(x+5) = 0$ then x must be either equal to 3 or -5. (It is important that you understand this last statement!)

Here's how this can be used to solve a quadratic equation:

Example:

Solve $x^2 + 3x = 8x - 6$

$$x^2 + 3x - 8x + 6 = 0$$

$$x^2 - 5x + 6 = 0$$

$$(x - 3)(x - 2) = 0$$

$$x = 2 \text{ or } 3$$

Note that we can check our answer by plugging either 2 or 3 into the original equation and it should work!

Solve.

1) $x^2 - 7x = 6x - 30$

2) $x^2 + 13x = 10x + 28$

3) $4x^2 + 13x = 3x^2 - 30$

4) $4x^2 + 13x = 5x^2 - 30$

5) $x^2 + 24 = 2x(x - 5)$
